

NOW AVAILABLE IN NEW SIZES!

Do You Have Patients With High Aesthetic Expectations?
Try The GingiHue® Abutment!

The **BOMET 3i** GingiHue® Abutment

Gold-Colored Titanium Nitride Coating Produces A Natural Hue Through Thin Soft Tissue Margins

Designed For A Natural Aesthetic Emergence Through Soft Tissue

Abutment Can Be Prepared Intraorally Similar To Natural Teeth

Abutment May Also Be Prepared In The Laboratory From An Implant Level Impression

Providing Clinicians One Solution At A Time With The GingiHue® Abutment

- Provides A Warm Natural Color Through The Gingiva
- Gold Colored And EP® Dimensions Provide Optimal Aesthetics
- Abutment Can Be Prepared In Areas Of Variable Tissue Height
- Conventional Techniques May Reduce Overhead Costs

A Solution For Patients With High Aesthetic Expectations

Implant restorations are a significant investment and your patients have high aesthetic expectations. The grayish hue through thin gingival tissues common with the use of titanium (silver metallic) abutments can compromise those expectations. The solution is the GingiHue® Abutment, which unlike titanium abutments, has a gold-colored titanium nitride coating that provides a warm, natural hue through the gingiva, apical to the restoration.

The GingiHue® Abutment For Optimal Aesthetics And Ease Of Use

The GingiHue® Abutment Has A Gold-Colored Titanium Nitride Coating And Provides A Warm Hue. This Blends Naturally With Soft Tissue That Is Adjacent To Porcelain-Fused-To-Metal Restorations.

GingiHue® Abutments Are Designed With EP® (Emergency Profile) Dimensions For A More Natural Aesthetic Emergence Through Soft Tissue.

Use Familiar Crown And Bridge Techniques With The GingiHue® Abutment

**Adjusted
For Occlusal
Clearance**

Prepared

In areas of even soft-tissue margins, the GingiHue® Abutment may only require minor adjustment for interocclusal clearance.

In areas of variable soft-tissue height, the GingiHue® Abutment may be prepared to follow gingival contours to maximize aesthetic outcomes and peri-implant soft-tissue health.

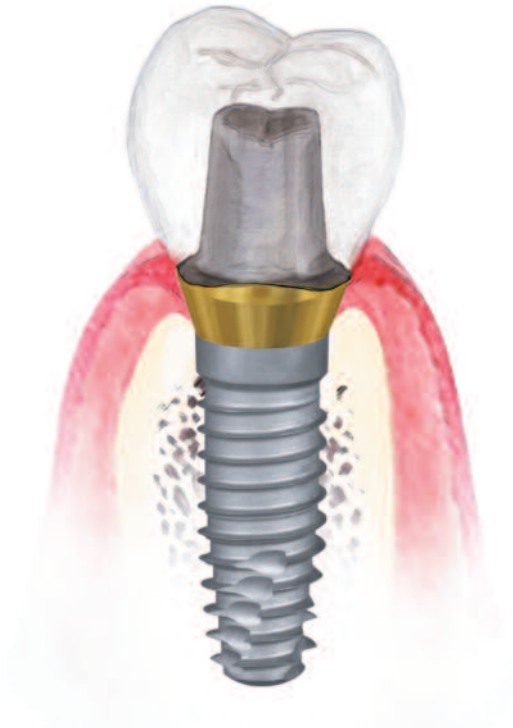

Direct chairside techniques may be used to restore implants, eliminating additional components and reducing laboratory fees.

Indirect techniques may be used to prepare a GingiHue® Abutment to resemble a custom abutment; reducing chairtime for the restorative clinician.

GingiHue® Abutments – Closely Mimic Conventional Therapy

GingiHue® Abutments can be prepared minimally intraorally much like the preparation of natural teeth.

- May be used to replace high-noble custom abutments, reducing laboratory fees and alloy cost
- With intraoral preparation of the abutment, overhead costs of purchasing additional components and instrumentation are reduced
- Laboratory procedures and costs are more consistent with standard crown and bridge therapy

The GingiHue® Abutment In Clinical Use

Three months after implant placement, the soft tissue matured and the patient returned to the office for the prosthetic phase. The healing abutments were removed.

Implant Pick-Up Impression Copings were placed for an open tray impression. For the Certain® Connection, the copings can be snapped on and tightened with the fixation screw.

The GingiHue® Abutments were prepared in the dental laboratory.

The prepared GingiHue® Abutments were placed and secured with retaining screws and were tightened to 20Ncm.

GingiHue® Abutments in place. Note how the preparation of the abutments follow the uneven gingival contours.

Lateral view of the definitive restoration in place.
